Objective: Persistent “Projects” that auto-run until paused: poll a CSV URL, parse rows (incl JSON cols), run model w/ stored system prompt, write outputs to linked Google Sheet using configurable headers, and cache processed rows so only new rows run each interval.
Core objects: Project = {config + state + cache + run logs + output destination}. States: Draft, Active, Paused, Archived/Deleted.
Project config (required): name; csv_url; poll_interval; csv_parse{delimiter(default ,), encoding(default utf-8), json_columns[]}; row_key_strategy{type=columns|hash, params}; model; system_prompt(versioned); gsheet{spreadsheet_id, tab_name}; output_schema{headers[] (ordered, user-configurable), field_mapping{internal_field->header}, write_mode=append|upsert, key_column(if upsert)}; limits{max_rows_per_run, concurrency/rate limits (safe defaults ok)}; behavior toggles{reprocess_on_change? (optional), keep_cache_on_relink?}.
Default header template (editable): Row ID, Task Number, Artist, Task ID, Turn, Block: Write a Prompt (Prompt), Block: Multiple Model Responses (Response_one), Violative, Policy, Subtopic, Severity, Justification, category_number, category_name, tactic_id, tactic_name, reasoning, classification_error, task_error.
Runner loop (while Active, each interval): fetch CSV → parse/normalize rows (JSON-decode configured cols; failures captured) → compute row_key per strategy → diff vs cache → for each new row: build model request(system_prompt + row payload) → call model → produce internal result object → map to sheet row via output_schema.headers[] + field_mapping → write to gsheet (append or upsert) → update cache → record run metrics.
Caching requirements: per-project store of processed row_keys (and optional row_fingerprint for change-detection); minimum: if row_key seen, skip; optional: if reprocess_on_change enabled and fingerprint changed, re-run/upsert.
Sheet initialization/validation: on first run or schema change: ensure tab exists; enforce headers[] as row 1 (either fail fast on mismatch or auto-fix per config); write only configured headers in configured order; missing mapped values write blank and set classification_error if configured.
Controls/APIs (must-have): Create/Update Project (incl headers + mapping); Activate/Start; Pause; Resume; Run Now; Reset Cache (clear cache only); Reset & Relink Sheet (change spreadsheet/tab; choose keep/reset cache); Update CSV URL (choose keep/reset cache).
Error handling/logging: row-level errors don’t stop run; populate task_error for parse/model/sheet failures; classification_error for schema/output-format issues; per-run log: run_id, timestamps, status, rows_fetched, rows_new, rows_processed, rows_failed, error summary.
MVP: (1) Create project w/ csv_url, interval, model, system prompt, gsheet target, configurable headers/mapping (2) Active polls on schedule, initializes/validates sheet, writes rows per schema (3) subsequent intervals process only new rows via cache (4) pause/resume preserves cache (5) reset cache reprocesses on next run (6) relink sheet works deterministically w/ keep/reset cache option (7) errors captured per-row + run metrics emitted.
